

# Health and Wellness food Market projections

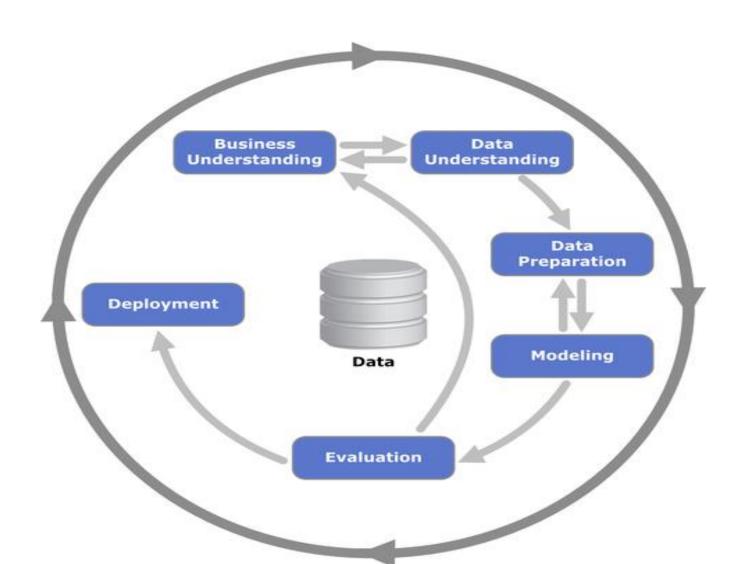

# **Objectives**

- Evaluating the neighborhood venues demands Exploring and classifying the venues of a neighborhood through geospatial data is an efficient way to evaluate all the services that such community has available.
- Additional considerations to open a new Healthy Food Store The study will also include the number of healthy food-related restaurants /venues in order to get insights about the lifestyle of the neighbors.

# Approach and Methodology

#### **CRISP-DM Methodology**

- 1. Business understanding.
- 2. Data Understanding
- 3. Data Preparation
- 4. Modeling
- 5. Deployment

# **CRISP-DM Methodology**

- **Business understanding:** Analysis of the problem to be solved. In our case, to get information about the best places to open new Healthy Food and wellness restaurants in Toronto.
- **Data Understanding:** The data needed for performing the study. In our case the data is the demographic and geographic data of the boroughs and neighborhoods in Toronto, the postal code and the respective geospatial coordinates for each neighborhood and the list of Venues for each location.
- **Data Preparation:** Prepare pandas data frame with the neighborhoods, boroughs and postal code (pandas data frame with the geospatial coordinates for each neighborhood, and the list of venues using the FoursquareAPI)
- **Modeling:** Create a map of Toronto's neighborhoods, a machine learning algorithm based on a Kmean approach to segment and cluster the list of venues in each neighborhood. Also we need to evaluate the model creating a map of the clusters and evaluate the accuracy of the kmean algorithm during the clustering process.
- **Deployment:** According to the frequency of the Healthy Food Stores and other venues like gyms or parks in each neighborhood, make a conclusion about which one would be the best to open a new store

#### **DATA**

- Geographic data about Toronto's neighborhoods: https://en.wikipedia.org/wiki/List\_of\_postal\_codes\_of\_Canada:\_M
- Geospatial Coordinates information: Geocoder platform https://geocoder.readthedocs.io/index.html
- List of Venues available at the FoursquareAPI: (https://developer.foursquare.com/docs/api/venues/e xplore)
- Other tools and library used: Pandas library, Numpy library, Foursquare API, Folium library, Geopy library

#### • Data frame generated with Panda

• Machine learning (K-means) approach to cluster the neighborhoods

\*\*All red points are cluster 1

• Cluster 1 (cluster label = 0) (Red color): The Cluster 1 is formed by neighborhood with a high density of restaurants of a diverse range of options. It includes food from different places of the world, being the Asian food restaurants extremely popular. This cluster is probably has a lot of competitors but also a big population density

• Cluster 2 (cluster label = 1) (Purple color): In this cluster we can see the venues of three neighborhoods where there are not so much restaurants but there are a lot of parks, playgrounds, gyms and sport venues that can be a good sign to invest in the healthy food industry.

#cluster 2
toronto\_merged.loc[toronto\_merged['Cluster Labels'] == 1]

	- 1	Postal Code	Borough	Neighborhood	Latitude	Longitude	Cluster Labels	1st Most Common Venue	2nd Most Common Venue	3rd Most Common Venue	4th Most Common Venue	5th Most Common Venue	l	7th Most Common Venue	8th Most Common Venue
1	20	M4T	Central Toronto	Moore Park, Summerhill East	43.69066	-79.38356	1	Playground	Gym	Park	Tennis Court	Women's Store	Distribution Center	Farm	Falafel Restaurant

#### **Conclusions**

- After preparing, modelling and analyzing the data, it can be concluded that the k-mean algorithm of the machine learning approach is very useful to find segmentation in real life application that involves studying the market, competitors, target, segments, etc.
- We found there are 2 neighborhoods(cluster 4 and 2) with great potential to open a healthy food and wellness restaurant or facilities and two more neighborhoods in which, even with a lot of competitors, the target customers can be found because of the great population density (cluster 1 and 5).
